

iDB® and iVIBE® Performance Tests – Sound

Identical circuits are used in both instruments and in what follows we refer to them collectively as iVIBE.

The iVIBE sound processing circuits are designed to meet the Class 1 requirements of BS EN 61672-1:2013. The ultimate performance of the instrument will depend on whether a Class 1 or Class 2 microphone is used. The following tables and charts give details of the typical performance of the iDB and iVIBE instruments when an electrical stimulus is applied instead of the microphone.

For the purpose of these tests, the instrument was calibrated to give a reading of 94.0 dB when a 50.0 mV RMS 1.0 kHz sine wave stimulus is applied to the microphone input. The ACO 7146 Class 1 microphone (with integral preamplifier) normally supplied with the iVIBE has a typical sensitivity of 42.2 mV/Pa at 1.0 kHz (i.e. about -1.4dB less). A typical performance chart for this microphone is given in the Appendix

The iVIBE records inputs between +30 dB and +125 dB on a single range with a linearity of better than ± 0.5 dB for inputs greater than 40 dB.

The iVIBE noise floor, as measured with the microphone input shorted, is typically 25 dB or less for both the A and C weightings with 50mV/Pa sensitivity.

iVIBE is able to measure and record A and C frequency weightings simultaneously together with L_{Cpeak} and overload time as a percentage of measuring time. Both instruments also contain an accurate atmospheric pressure sensor.

For the purposes of these tests, the stimulus signals were generated by a TTI 50 MHz Function Generator (Model TG5011) and the RMS stimulus voltages measured by a Keysight 6.5 digit DVM (Model 34461A). A -50.00 dB precision attenuator was also used.

The test results confirm that the performance of the iDB and iVIBE sound processing circuits exceed the Class 1 requirements of BS EN61672-1:2013.

Note: 158.1 µV signal generated using a -50.00 dB attenuator

Level Linearity - BS EN 61672-1 Section 5.5

iVIBE has a single measurement range spanning 95 dB for sound pressure levels between 30 dB and 125 dB for both A and C frequency weightings. Performance tests were carried out at frequencies of 4.0 kHz, 1.0 kHz and 40 Hz. Stimuli below 10 mV RMS were generated with the aid of a -50.00 dB precision attenuator.

For BS 61672 Class 1, the linearity deviations (Dev.) shall not exceed ± 0.8 dB over the linear measurement range of the instrument and shall not exceed ± 0.3 dB within any 10 dB portion thereof.

| | | |

Time-weightings F and S – BS EN 61672-1 Section 5.8

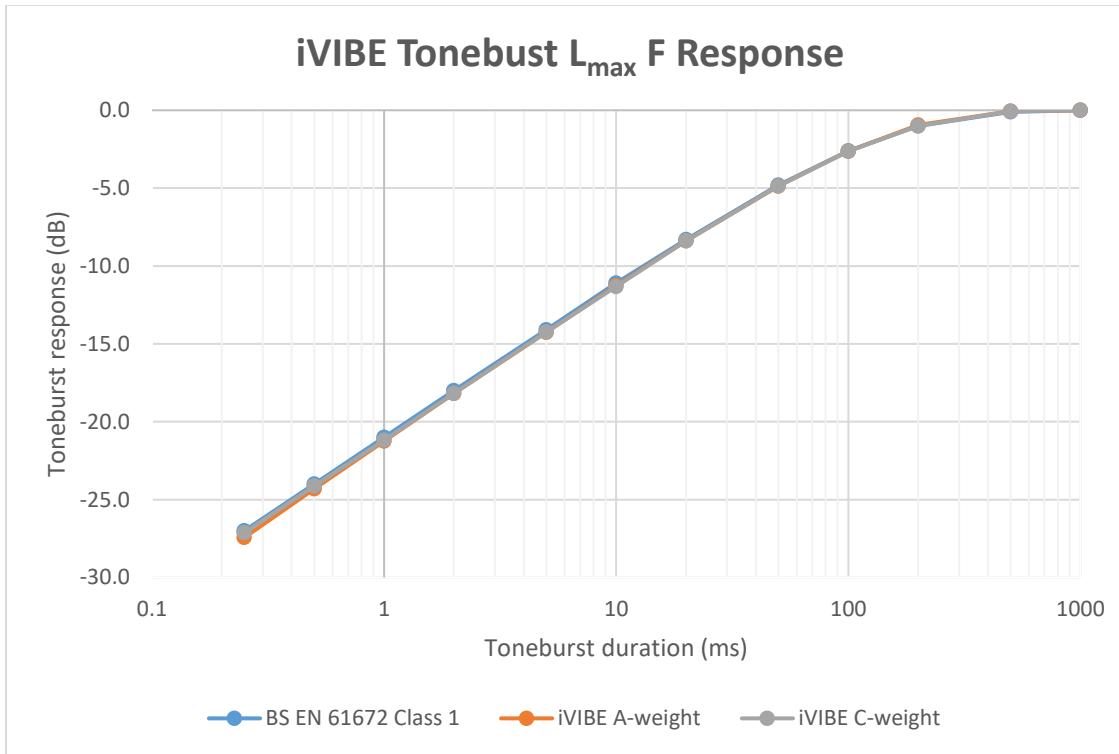

iVIBE uses digital filters to meet the design goal time constants of 0.125 sec for the F time weight filter and 1.0 sec for the S time weight filter. Their accuracy is confirmed by the accuracy of the following toneburst measurements.

Toneburst Response - BS EN 61672-1 Section 5.9

4.0 kHz toneburst, L_{max} response, F time weighting

iVIBE: $L_A = 114.8$ dB, iVIBE: $L_C = 113.0$ dB

APPENDIX – CLASS 1 MICROPHONE PERFORMANCE

Calibration Chart

1/2" Prepolarized Microphone

Cartridge TYPE : 7146
Serial No : 64634/9873
Sensitivity (at 250Hz) : 48.4 mV/Pa
-26.3 dB re 1V/Pa
Cartridge Capacitance : 17.4 pF
Polarization Voltage : 0 V
Pressure Sensitivity (Included preamplifier) : 42.2 mV/Pa

Envitomental Calibration Conditions
Temperature : 24 °C
Humidity : 62 %
Barometric pressure : 994 hpa
Date : 2016/5/13
Operator : S. A.
